

Self evaluation 34315

Individual part

Name: Anders Falkesgaard

Student number: s245905

Which tasks have I contributed to in the prototype? (If shared with others add %)

Practical (Printing of poster, Creation of Discord/Overleaf/Github)

3D-printing(~70 %) and mechanical troubleshooting/implementation on the printed parts

Power-calculations

Poster design (90%)

Code, LM35 and IIR Filter (~80%)

Code, OLED (~70%)

Initial state diagram

What is the technical difficulty level of my chosen tasks:

High

Medium

Low

Comments and reasoning:

The calibration and filter part of the LM35 was pretty time-consuming (a lot of datasheets and google), but I could adapt the filter from some of my previous code from another course, I could also recycle one of my former functions for the display, why reinvent the wheel again...

The poster design and 3d-printing I also have experience in from beforehand, so was very natural to work on those tasks.

In the power calculations I used formulas from an earlier course as well, making the power budget fairly straightforward to put together.

How much code have I approximate written? (specify functions and approx. number of lines)

readLM35 and **updateDisplay**

approx. 50-60 lines.

How have I approached the coding tasks (please circle or mark with X):

Written most from scratch/code from earlier projects
online tutorials / examples

Wrote code myself based on

Adapted examples found online

Asked the TAs to find the solution for me

I did not participate in the coding part

Which tasks have I contributed to in the report? (If shared with others add %)

Log Book
Setup in Overleaf
Overview/Coordination (requirements, practical stuff, Who-did-what)
Technical Highlights (Power calc)
Software Design (~50%)
Solution
Group Contract
Lead on the Group SelfEvaluation
Comment the code (~50%)
State Diagram figure

How much text and figures have I approximately written?

About 1-2 page in total
The State diagram figure

How have I described the tasks:

Excellent

Good

Fair

Poor

Comments and reasoning:

It is tricky to judge yourself, I think that I generally did a good job.

34315 is a 5 ECTS point course. Each ECTS point consists of 28 working hours. Totally 140 hours. This means approx. 10.1 hours for every single week in the 13 week period. Have I spent (please circle):

A lot less time

A little less time

Just about that time

A little more time

A lot more time

General comments about my work:

Overall I am happy with my work on the project. A lot of my tasks (3d-printing, poster, the LM35 filter and the display) built on experience or code from earlier courses, so I could work fast and put more time into the mechanical side and the practical coordination. I think I contributed my fair share and got a good deal out of it, both technically and from working together as a group.

Extra credit only:

Have I handed in the Simons Game:

Yes

No
